

GABE

Vision, Strategy & Product Blueprint (Version 2)

GABE – Vision & Product Strategy

The Bloomberg Terminal of Property Development

Executive Summary

GABE is envisioned as Australia's leading Property Development Operating System (PDOS). The platform unifies acquisition, feasibility, planning, construction, finance, asset management and investor reporting into a single ecosystem. The goal is to eliminate fragmented workflows and become the central source of truth for developers.

Industry Problem

Developers currently rely on dozens of disconnected systems. Critical information is spread across emails, spreadsheets, accounting software, construction software, consultants and cloud storage. This fragmentation creates inefficiency, risk, duplication and reduced profitability.

Mission Statement

To help property developers run projects more efficiently, profitably and confidently through a unified operating platform that manages the complete development lifecycle.

Vision Statement

To become the Bloomberg Terminal of Property Development: a platform where every project, asset, stakeholder, document and financial decision can be managed from one place.

Target Market

Primary target customers are Australian property developers delivering 5–30 townhouse projects. Secondary markets include apartment developers, childcare developers, industrial developers, commercial developers, build-to-rent operators, land subdivision groups, builders and property investment syndicates.

Core Value Proposition

Every file. Every project. Every asset. Every dollar. One platform. GABE is not a construction app, feasibility app or property management app. It is the operating system connecting all of them together.

Strategic Pillars

1. Development Intelligence 2. Construction Intelligence 3. Financial Intelligence 4. Asset Intelligence 5. Investor Intelligence

Development Intelligence

This module helps users identify, analyse and assess development opportunities. Features include site analysis, zoning review, overlay identification, yield estimation, feasibility modelling, risk scoring

and acquisition workflows.

Feasibility Engine

A sophisticated financial modelling engine comparable to specialised feasibility software. Supports townhouses, apartments, childcare, industrial, commercial, mixed-use, subdivisions and build-to-rent developments. Outputs include GRV, margin, IRR, cashflow and sensitivity analysis.

Construction Hub

An advanced construction management environment that stores drawings, permits, RFIs, defects, inspections, QA documentation, SWMS, compliance records and progress photos. The objective is to provide complete project visibility from the office and the site.

Financial Control Centre

The financial module compares original feasibility assumptions against live project performance. Automated invoice capture, budget tracking, forecast profit reporting, variation management and cashflow forecasting create a real-time understanding of project health.

Asset Intelligence

A portfolio-wide asset management system tracking valuations, debt, equity, rent, yields, ownership structures and property performance. Developers can monitor long-term wealth creation beyond project completion.

Investor Intelligence

One-click generation of lender packs, investor packs and joint venture reports. Developers can control visibility and share only relevant project information with funding partners.

AI Strategy

GABE's long-term vision is action-oriented AI. Instead of simply answering questions, AI agents perform work. Future AI agents include Development Manager, Cost Controller, Contract Administrator, Asset Manager and Capital Raising Assistant.

User Portals

Executive Portal: portfolio oversight and strategic reporting. Development Portal: acquisition, planning and feasibility. Construction Portal: delivery and compliance. Asset Portal: portfolio and rental management. Investor Portal: stakeholder reporting and capital raising.

Security & Permissions

Role-based permissions ensure users only access authorised projects and information. Supervisors, administrators, executives, investors and contractors receive tailored access levels.

Integrations Roadmap

Priority integrations include Xero, MYOB, QuickBooks, Outlook, Gmail, Google Drive, SharePoint and OneDrive. Future integrations may include property data providers, valuation services and planning databases.

Mobile Ecosystem

Dedicated mobile applications will allow supervisors to manage defects, inspections and progress photos onsite while executives monitor project performance and investors receive project updates.

Competitive Positioning

GABE combines functionality traditionally delivered by multiple products. Rather than replacing one software category, GABE aims to become the operating layer above all development workflows.

Commercial Opportunity

The Australian development market lacks a unified platform designed specifically for developers. GABE has potential to serve developers, builders, syndicates and build-to-rent operators through recurring SaaS revenue.

Three-Year Roadmap

Phase 1: Feasibility, documents and construction management. Phase 2: Portfolio management and investor reporting. Phase 3: AI automation and predictive analytics. Phase 4: Capital raising and marketplace functionality.

Success Metrics

Reduction in administrative workload, improved budget control, increased project visibility, reduced information loss and improved decision-making across development businesses.

Conclusion

GABE's ambition is to become the central operating system for property developers. By connecting acquisition, delivery, finance and asset ownership into a single ecosystem, the platform creates a new category of software focused entirely on the needs of modern developers.
